

Helix Thready → PenPot import bundle

Exact import steps

- A. SVG vectors (editable) — the primary PenPot deliverable
- B. Screen PNGs (raster reference)

Honest boundaries — VERIFIED

PenPot (penpot.app) imports **SVG** and **PNG/JPEG** natively. It has **no** native OpenDesign, Figma-`.fig`, or Lottie importer. This bundle is therefore split by exactly what PenPot can do with each artifact — nothing here is misrepresented as editable when it is not.

Path	What	PenPot import result — HONEST
<code>svg/*.svg</code> (16)	<code>components</code> <code>-sheet.svg</code> (the whole component library board) + brand lockups (<code>logo-full</code> , <code>logo-mark</code> , <code>footer-slogan</code>) + the 4 launcher-icon variants + 8 design-system diagrams	Native editable vectors — real paths / text / groups you can move and restyle.
<code>png/</code> <code><area>/</code> <code>*@2x.png</code>	Every screen rendered at 2× in both light and dark (web · mobile · desktop · TUI · library · motion)	Raster images — PenPot places these as flattened bitmaps. Reference/underlay only, not editable UI.

Exact import steps

A. SVG vectors (editable) — the primary PenPot deliverable

1. Open PenPot → open or create a **Project** → open a **File**.
2. Top-left **menu** (≡) → **Import files...** (or drag the `.svg` straight onto the canvas).
3. Select one or more files from `svg/` → **Import**.
4. Each SVG lands as a board/group of editable vector layers. `components-sheet.svg` gives the whole component sheet as one editable board; the brand + diagram SVGs come in as their own vector groups.

B. Screen PNGs (raster reference)

1. Same **menu** (≡) → **Import files...** (or drag-drop).
2. Select PNGs from `png/<area>/` → **Import**. Each becomes an image layer at its intrinsic pixels. These are **2× renders**, so scale to **50%** for 1:1 CSS-px sizing.
3. Use them as a pixel-accurate backdrop to trace/rebuild native PenPot components on top. Import the `-dark@2x.png` variant to work against the dark theme.

Honest boundaries — VERIFIED

- **Per-screen vector SVG is not feasible** with the available toolchain. The screens are self-contained HTML/CSS; headless Chromium / WeasyPrint / ImageMagick can rasterize HTML to PNG/PDF but **cannot emit a faithful HTML→SVG vector** of a full screen (complex CSS layout, grids, shadows, pseudo-elements). So full screens ship as **PNG (raster)** — exactly the mandate’s “...plus the PNG renders” fallback. The only true vectors are the hand-authored brand / component / diagram SVGs in `svg/`, which import as editable geometry.
- **No PenPot API / cloud push.** No PenPot token exists in this environment; import is the operator-run **File → Import** flow above. Nothing here contacts a PenPot server. `[OPEN]` a cloud push would be operator-interactive.
- PenPot’s SVG importer flattens some advanced CSS-derived effects; `components-sheet.svg` was authored as a clean vector sheet so it round-trips well.

Made with love ♥ by Helix Development.
